

Antiviral Drugs: An Overview

The Outline

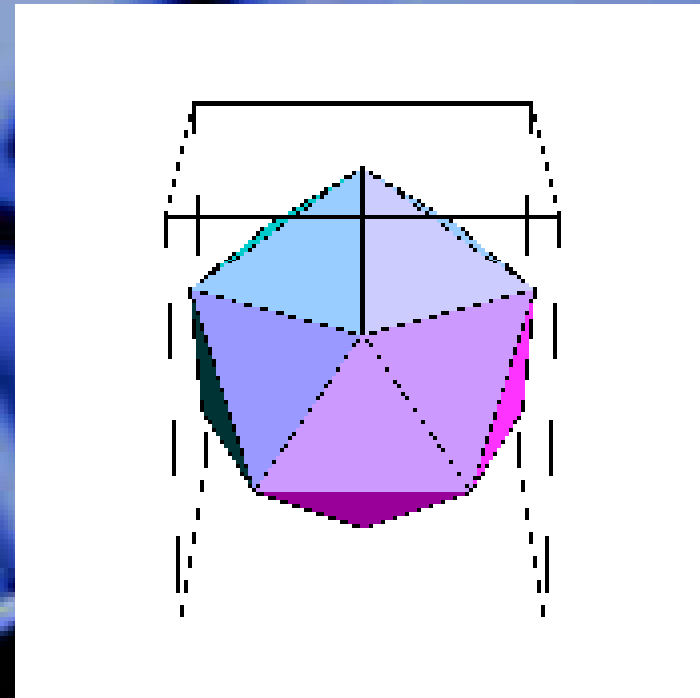

1. Viruses, what are they, who are they?
2. Virus Classifications
3. The virus, its hidden personal life
4. Methods of Attack
5. Building the Weapon: Drug Development
6. The Weapon of Choice: Antiviral Drugs
7. Conclusions and Overview

Viruses, what are they?

- Viruses do not fit the mold for a living organism
- Viruses are all parasites of the living
- They cannot make anything on their own, they use the cell's materials to build themselves
- Origin: Speculated to be rogue segments of DNA that have taken a parasitic role

Viruses, who are they?

- The Capsid: A protein shell of capsomer subunits. It has three purposes: to Shield, Attach, and Penetrate
- The Envelope: Hybrid combination of cell lipids and virus proteins, permits attachment (note spikes)
- Nucleic Acids: Either DNA or RNA enclosed within the capsid that is later used to replicate more viruses within the host cell

Virus Classifications

- Two types of Classification, The Baltimore System and the International Committee on Taxonomy of Viruses (ICTV)
- The ICTV Version uses a common biology taxonomy approach and is the current accepted standard of the 80 families and 4000 species of Virus
- The Baltimore System was devised by Nobel prize winning biologist David Baltimore and separates viruses according to nucleic acid type (DNA or RNA), method of replication (positive-sense, negative-sense) and the number of strands (single or double strand)

Virus Classifications

• Many Families are not classified in the system due to grouping difficulty

4 DNA Virus

Virus Family	Viral Name	Virus Latent (integrated)	Capid Symmetry	Type of nucleic acid
1 Adenovirus	Adenovirus	No	Icosahedral	ds
2 Papovaviridae	Papovaviridae	No	Icosahedral	ds/circular
3 Herpesviridae	Herpes virus	Yes	Icosahedral	ds
4 Hepadnavirus	Hepatitis B virus, Xantho virus, etc., Carpenter virus, Japan B virus	Delayed	Icosahedral	ds
5 Poxviridae	Smallpox virus, Variola virus	Complex capsid	Complex	ds
6 Herpesviridae	Herpes B virus	Delayed	Icosahedral	ds/circular

• Some RNA Viruses are positive-sense or negative sense, in other words they can directly act like mRNA (+) or they need a RNA transcriptase to be included in the virus (-)

4 RNA Virus

Virus Family	Viral Name	Virus Latent (integrated)	Capid Symmetry	Type of nucleic acid
1 Picornaviridae	Rhinovirus, Poliovirus	No	Icosahedral	ss (+)
2 Flaviviridae	Hepatitis A Virus, Dengue Virus, Yellow Fever Virus	No	Icosahedral	ss (+)
3 Parvoviridae	Parvovirus B19, Parvovirus D22	No	Icosahedral	ss (-)
4 Rotaviridae	Rotavirus	Delayed	Wheel-like	ss (+)
5 Coronaviridae	Common Cold Virus, SARS Virus	Delayed	Helical	ss (+)
6 Herpesviridae	Herpes Simplex Virus, Varicella-Zoster Virus	Delayed	Icosahedral	ss (-)
7 Paramyxoviridae	Measles Virus, Mumps Virus, Parainfluenza Virus	Delayed	Helical	ss (-)
8 Rhabdoviridae	Rabies Virus	Delayed	Helical	ss (-)
9 Bunyaviridae	Bunyavirus, Hantaan Virus, Rift Valley Fever Virus	Delayed	Helical	ss (-)
10 Filoviridae	Ebola Virus, Marburg Virus	Delayed	Helical	ss (-)
11 Retroviridae	HIV, HTLV, HTLV-8	Yes	Icosahedral	ss (-)
12 Hepadnaviridae	Hepatitis B Virus	Delayed	Icosahedral	ss (-)

The Virus' Personal Life

Single cell reproductive cycle of HAV

Antivirals, why?

- Vaccines are effective at prevention but what about the patient that is already infected?
- Viruses can be very swift and deadly and a quick method of curing a patient is needed
- The market is huge and a remedy would bring about solutions to viral infections such as: Influenza, HIV, Herpes, Hepatitis B, Smallpox, Ebola, Rabies, etc.

Methods of Attack

Methods of Attack

- Viruses still need more study to understand their structure and life cycle
- The most effective methods so far can only attack by preventing the virus from attaching to the cell and from leaving the cell

Drug Development

- Viruses are now becoming better understood and several viral genomes have been properly mapped. Scientists are now looking for the best drug targets
- The main point of interest is any viral protein that the host organism does not normally produce
- Once these viral proteins are identified they are tested using a large scale screening process to test for effectiveness

Drug Development

- Antiviral candidates are tested in mass quantities
- Antiviral drugs generally have strange side effects and a high toxicity
- As with any pathogenic drug, Viruses evolve and develop immunity. Thus the need for new drugs always exists

Drug Development

There are several known methods that the makers of Antiviral drugs are looking at, including:

- Prevention of Viral Entry
- Targeting the RNA/DNA replication in the cell
- Targeting the transcriptase factors for Viral DNA
- Destroying Viral proteases so that viral proteins are not cut and rearranged in optimal order
- Stopping the release of the mature viruses from the host cell

The Weapon of Choice: Antiviral Drugs

Antivirals (primarily JSA, also SRIAD and IRIAD)	
Anti-herpesvirus	Acyclovir, Ganciclovir, Docosanol, Famciclovir, Foscarnet, Foscarnet, Ganciclovir, Idoxuridine, Penciclovir, Trifluridine, Trinitololololol, Valaciclovir, Valganciclovir, Vidarabine
Anti-influenza agents	Amantadine, Astatin, Oseltamivir, Peramivir, Rimantadine, Zanamivir
Antiretrovirals: NRTIs	Abacavir, Didanosine, Emtricitabine, Lamivudine, Stavudine, Zalcitabine, Zidovudine
Antiretrovirals: NNRTIs	Tenofovir
Antiretrovirals: INSTIs	Etravirin, Delamanvir, Raltegravir, Loviride
Antiretrovirals: PIAs	Atazanavir, Abacavir, Darunavir, Fosamprenavir, Indinavir, Lopinavir, Nelfinavir, Ritonavir, Saquinavir, Zalcitabine
Antiretrovirals: Fusion Inhibitors	Enfuvirtide
Other antiviral agents	Adifovir, Fomivirsen, Intravenous, Inosine, Maribavir, Pritelivir/Abirin, Ribavirin, Vidarabine

Drug Examples

Tamiflu-

- Recently sold to 40 countries to battle avian flu
- Prevents the mature viruses from leaving the cell
- It is a neuraminidase inhibitor, it works on both influenza A and B
- Neuraminidase is an enzyme found on the virus which cleaves sialic acid from cell membrane, leading to a more effective release of viruses. [mechanism](#)

Drug Examples

Aciclovir-

- A widely used antiviral with main implications in the treatment of herpes
- Seen as a “new age” in antiviral therapy, Gertrude Elion, its creator, was given the Nobel prize for medicine in 1988
- It is a nucleoside analogue and prevents viral replication in infected cells

Conclusions: Viruses of the future?

- With further understanding of Virus Genomes and virus' receptors, antiviral drugs will be more effective
- An understanding of the processes within the cell might lead to whole new classes of antiviral drugs
- Antiviral drugs are very experimental as of right now and hopefully with further discoveries, new processes of synthesis will be discovered

What just happened?

1. Viruses, what are they, who are they?
2. Virus Classifications
3. The virus, its hidden personal life
4. Methods of Attack
5. Building the Weapon: Drug Development
6. The Weapon of Choice: Antiviral Drugs
7. Conclusions and Overview
